Calendar Agent / Architecture

One shared agent core behind two channels — Telegram for people, MCP for AI agents.

Each channel runs on its own Cloud Run server and feeds the same agent core. Secret Manager supplies credentials at startup, and Cloud Scheduler kicks off Core Server's daily scan. The core reads Google Calendar and keeps its state in Firestore — but **a proposal only becomes a real Calendar write once the owner taps Approve in Telegram**, whether a person or an external agent created it.
